BARCELONA DECLARATION CONFERENCE · BERLIN · 24–25 NOVEMBER 2026

Better metadata, better decisions

How the Dutch Barcelona Declaration signatories monitor and improve their open research information, so their analyses and strategic reports rest on reliable data

Maurice Vanderfeesten · SURF · maurice.vanderfeesten@surf.nl
with the Netherlands Barcelona Declaration Network

WHY IT MATTERS

We don't fill in ORCIDs for the sake of ORCIDs. Better metadata gives institutions analyses and strategic reports they can trust.

Better metadata → Reliable open research information → Trustworthy analyses and reporting

Built with and for the Dutch Barcelona Declaration signatories

Their research intelligence, library and CRIS teams depend on high-quality data in their daily work. They shaped every step: they brought the use cases, prioritised the metadata, tested the dashboard and now set their own goals with it.

The 18 organisations taking part in the ORI dashboard (ori-dashboard.surf.nl, November 2026)

From consultation to metrics to dashboard

Consult

Use cases first

Signatories brought 14 use cases, such as open access monitoring and linking sources. They point to **DOIs**, **ROR** and **ORCID**.

Measure

Metrics that matter

Measure only what the use cases need: CRIS compared with OpenAlex, OpenAIRE and Crossref.

Monitor

Dashboard

Each institution sees its own gaps, with interventions ranked by effort and impact.

Improve

Signatories set goals

Onboarding helps each institution choose its improvements and track the effect.

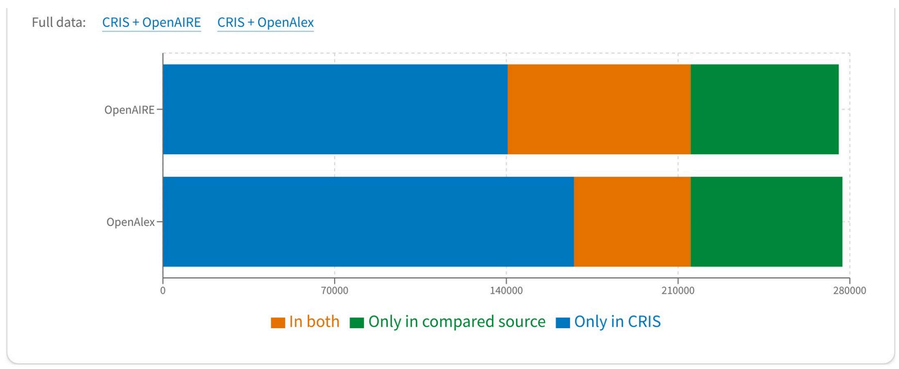

Four questions behind every reliable report

Live views for one participating institution, ori-dashboard.surf.nl, November 2026. Accuracy: view from the dashboard mockup with illustrative data, as the live feed does not publish it yet.

COVERAGE

Is all our output in the open indexes?

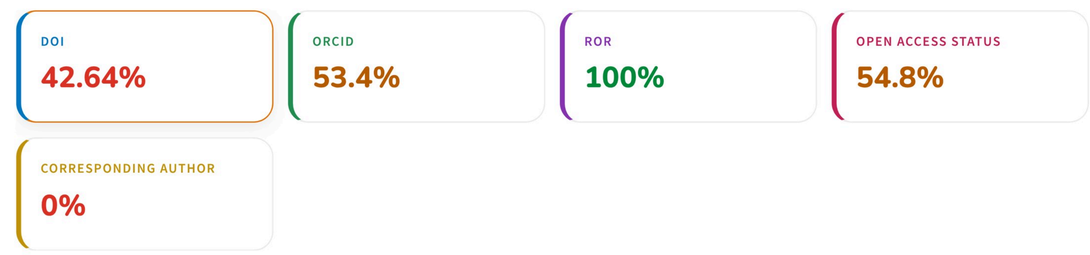

So open access monitoring counts everything.

COMPLETENESS

Can we link output to people and places?

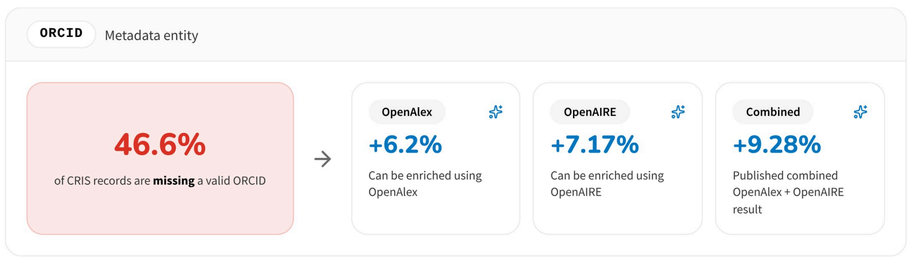

So analyses per researcher, group or partner hold up.

ENRICHMENT

What can other sources fill in?

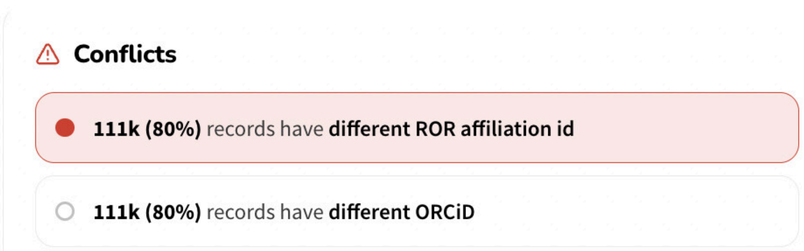

So the CRIS improves with less manual work.

ACCURACY

Can we trust the affiliations?

So reports and benchmarks credit the right institution.

Fully open, behind the scenes

- A public data lake with OpenAlex, OpenAIRE, CRIS and OpenAPC: every number is reproducible.

What worked

- Starting from the signatories' use cases made the value of better data concrete.

What was hard

- Accuracy has no single ground truth, and sources copy each other's errors.

What's next

- BROCCOLI maintains the dashboard and data lake; DURF the governance.

Set your own goals for better open research information

ori-dashboard.surf.nl · surf-ori.github.io/pid2portal-project

Part of the PID to Portal project, led by SURF and funded by Universities of the Netherlands (UNL). Reports by Bianca Kramer (Sesame Open Science). All code, data and reports are open.
