BARCELONA DECLARATION CONFERENCE · BERLIN · 24–25 NOVEMBER 2026

Better metadata, better decisions

How the Dutch Barcelona Declaration signatories monitor and improve their open research information, so their analyses and strategic reports rest on reliable data

Maurice Vanderfeesten · SURF · maurice.vanderfeesten@surf.nl
with the Netherlands Barcelona Declaration Network

WHY IT MATTERS

We don't fill in ORCIDs for the sake of ORCIDs. Better metadata gives institutions analyses and strategic reports they can trust.

Better metadata → **Reliable open research information** → **Trustworthy analyses and reporting**

Built with and for the Dutch Barcelona Declaration signatories

Their research intelligence, library and CRIS teams depend on high-quality data in their daily work. They shaped every step: they brought the use cases, prioritised the metadata, tested the dashboard and now set their own goals with it.

Members of the Netherlands Barcelona Declaration Network, early 2026

From consultation to metrics to dashboard

Consult

Use cases first

Signatories brought 14 use cases, such as open access monitoring and linking sources. They point to **DOIs**, **ROR** and **ORCID**.

doi.org/10.5281/zenodo.18667698

Measure

Metrics that matter

Measure only what the use cases need: CRIS compared with OpenAlex, OpenAIRE and Crossref.

doi.org/10.5281/zenodo.23682960

Monitor

Dashboard

Each institution sees its own gaps, with interventions ranked by effort and impact.

ori-dashboard.surf.nl

Improve

Signatories set goals

Onboarding helps each institution choose its improvements and track the effect.

18 organisations taking part

Four questions behind every reliable report

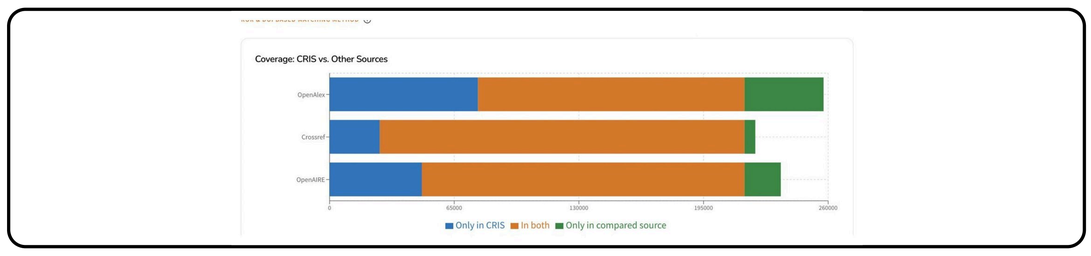

Example views from the dashboard (illustrative data, from the metrics report)

COVERAGE

Is all our output in the open indexes?

Records only in your CRIS, in both, or only in an open source.

So open access monitoring counts everything.

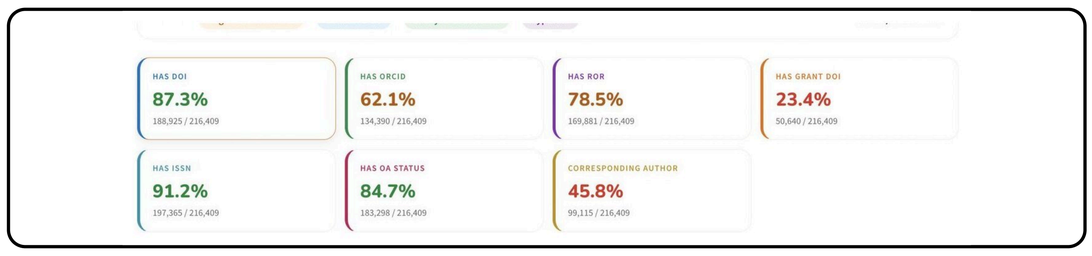

COMPLETENESS

Can we link output to people and places?

The share of records with a valid DOI, ORCID, ROR and more.

So analyses per researcher, group or partner hold up.

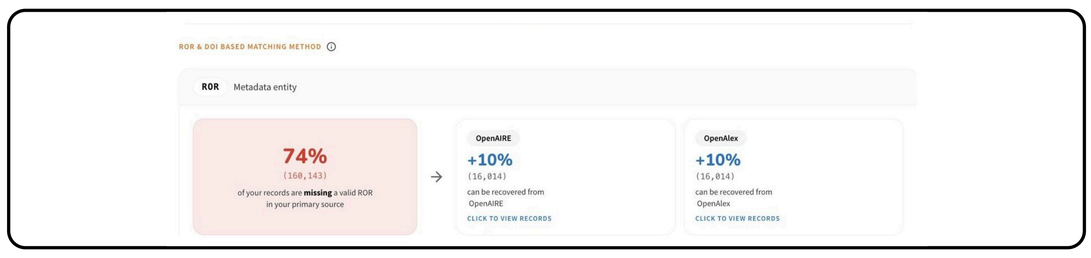

ENRICHMENT

What can other sources fill in?

Missing values that OpenAIRE or OpenAlex already have.

So the CRIS improves with less manual work.

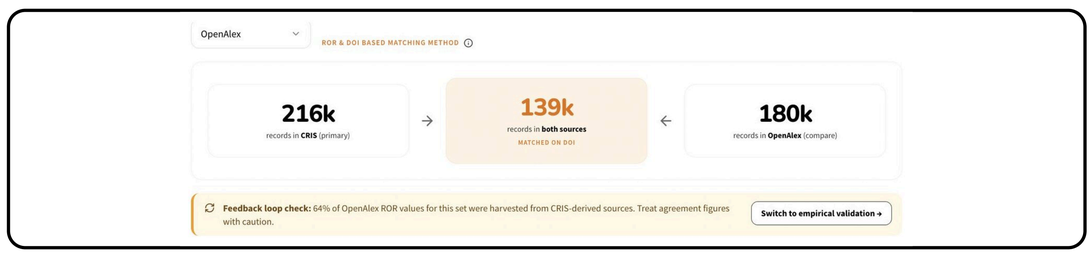

ACCURACY

Can we trust the affiliations?

Where sources disagree, and which one is wrong.

So reports and benchmarks credit the right institution.

Fully open, behind the scenes

- A public data lake with OpenAlex, OpenAIRE, CRIS and OpenAPC: every number is reproducible.
- Skills and an MCP server let non-technical users build auditable reports.

What worked

- Starting from use cases made the value of better data concrete.
- Co-design with signatories gave metrics they recognise.

What was hard

- Accuracy has no single ground truth.
- Sources copy each other, and their errors.

What's next

- BROCCOLI maintains the dashboard and data lake.
- Long-term governance in DURF.

Set your own goals for better open research information
